Program:

```
import java.net.InetAddress;
import java.util.Scanner;
public class myping {
    public static void main(String args[]) {
    Scanner sc = new Scanner(System.in);
    String host = sc.nextLine();
    my {
    InetAddress = InetAddress.getByName
    System.out.print("pinging" + host);
    long start time = System.currentTime();
    If (reachable) {
      System.out.println("Reply Out");
    else {
    System.out.print("Reply from" + getHo
    System.out.println("Host is not reached
    }
    } catch (Exception e) {
        System.out.println("Error");
    }
    sc.close();
} }
```

IMPLEMENT YOUR OWN PING PROGRAM

Aim:

To implement a ping program using socket programming to check whether a destination is reachable.

Procedure:

* Create a socket for communication with the destination host.
* Get the IP address of the destination host.
* Construct an ICMP Echo Request.
* Add the required ICMP header and sequence number.
* Record the time before sending
* Wait for the reply.
* Calculate the Round-Trip time
* Repeat the process for the required number of packet.
* Display the final statistics such as packet sent, received, lost.

Result:

Thus the Own Ping Program was successfully implemented to check the host reliability.
